Authentication

After creating an access key, you should use it in the `Authorization` header:

```
curl \
-X POST \
-H 'Authorization: Bearer eyJhb..........w5c' \
-H 'Content-type: application/json' \
'https://api.trytalo.com/v1/events'
```

Player authentication

When calling API endpoints on behalf of a player that is using player authentication you must send the following headers:

1. `x-talo-player`: the ID of the player
2. `x-talo-alias`: the ID of the player's identified alias
3. `x-talo-session`: the session token received after registering or logging-in a player

> **TIP**
>
> The Godot plugin and Unity package will automatically populate these headers for you. If you're receiving session-related errors, visit the Common errors page for more information.
