Game config API

Talo's live config allows you to configure your game directly in the dashboard. Your game can then fetch this config on-demand, allowing your game and players to have the latest information without downloading a new update.

Live config runs on a collection of key-value pairs. For example, you could have a key of "maxLevel" which has value of "10". While running a beta test you can incrementally increase this maximum level to allow access to more content at your own pace.

Learn more about live config here.

Endpoints

Get the live config for the game

`read:gameConfig`

GET `https://api.trytalo.com/v1/game-config`
